Sequence 246, Application Patent No. US20020177126A1 GENERAL INFORMATION:
APPLICANT: Young, James
APPLICANT: Young, James
APPLICANT: Scott, Koenig
APPLICANT: Leslie, Johnson
TITLE OF INVENTION: Methods of Adminstering/Dosing Anti-RSV.
TITLE OF INVENTION: and Treatment
TILE REFERENCE: 10271-047-999
CURRENT APPLICATION NUMBER: US/09/996,288
CURRENT FILING DATE: 2001-11-28
NUMBER OF SEQ ID NOS: 259
SOFTWARE: Patentin version 3.1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human CD4 cDNA was excised from pSP6T4 and cloned into M13mp18. The 2 kb PstI/PstI fragment from pBR lambda 1 contg. the human lambda 1 heavy chain gene (contg. the hinge, Ch2 and CT13 exons) was isolated and cloned into the BAP-treated M13mp18/CD4 vector. To obtain a CD4-lambda 1 chimeric heavy chain gene, oligonucleotide-mediated site-directed mutagenesis was performed to juxtapose the CD4 and lambda 1 heavy chain DNA sequences, ligating the CD4 sequence in frame to the hinge exon. The DNA was then cloned into pcDNA-1 to produce CD4-1gG1-pcDNA1 (ATCC 40951). (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 435 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CD4-gamma 1 chimeric heavy chain homo-dimer and its expression vector for preventing and treating HIV infection useful as a diagnostic agent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Example;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a CD4 (cluster of differentiation factor 4) polypeptide ligated at its C-terminus with a portion of an immunoglobulin (Ig) comprising a hinge region and a constant domain of a mammalian Ig heavy chain. The polypeptide comprises a tailpiece from the C-terminus of the heavy chain of an IgA or IgM antibody. Polypeptides of the invention are useful for preparing a composition for treating or preventing human immunodeficiency virus (HIV)-1 infection. The invention is useful in gene therapy and also in the preparation of vaccines. The present sequence is a fusion protein which comprises a human IgA alpha tailpiece (alphatp), a human IgC constant region comprising a hinge, a CH2 and CH3 region and a human CD4 DID2 domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New CD4 polypeptide ligated at its C-terminus with a portion of immunoglobulin, useful for preparing a composition for treating preventing HIV-1 infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence

                                                                                                                                                                                                                           The human CD4 cDNA is excised from the plasmid pSP674 and cloned into M13mp18. In order to excise a fragment containing the CH1 exon of the human gamma 1 heavy chain gene, the plasmid pBr gamma 1 is digested with SacII, and the SacII sites are then made flush using T4 DNA polymerase. The fragment containing the CH1 exon is then purified and ligated to the M13mp18 (CD4) vector. Oligonucleotide-mediated site-directed mutagenesis is then performed to juxtapose the CD4 and CH1 sequences in frame. The CD4-CH1 chimeric gene is then linearized and ligated to the Pst1-Pst1 DNA fragment of the plasmid pBr gamma 1 containing the hinge, CH2, and CH3 exons of the human gamma 1 chain gene designated CD4-IgGIHC-pRcCMV (ATCC 75192). (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      25-MAR-2003

The polypeptide comprises a tailpiece from the C-terminus of the heavy chain of an IgA or IgM antibody. Polypeptides of the invention are useful for preparing a composition for treating or preventing human immunodeficiency virus (HIV)-1 infection. The invention is useful in gene therapy and also in the preparation of vaccines. The present sequence is a fusion protein variant (G218P/L219V/220de1A/G221A) which comprises a human IgA alpha tailpiece (alphatp), a human IgA2 constant region comprising a hinge, a CH2 and CH3 region and a human CD4 D1D2 domain. This variant protein is also referred to as mutant F
                                                                                                                                                                                               Genetic construct which encodes CD4 linked to human IgG1 at the Esp upstream of the hinge region (fusion protein CD4E-gamma-1).
                                                                                                                                                    Fusion protein;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The fusion protein genes of the invention pref. comprise cDNA sequences which encode CD4 or a fragment which binds gp120 ligated to an expression plasmid which encodes an antibody in which the variable region of the gene has been deleted (see w87-02671). The CD4 portion of the fusion protein may comprise the complete CD4 sequence, the 370 AA extracellular region and the membrane spanning domain, or the extracellular region. The 1g heavy chain is pref. from IgM, IgG1 or IgG3. The following are specifically claimed: fusion proteins CD4H-gamma-1, CD4Mmu, CD4Pmu, CD4E-gamma1, and CD4Mmu (No.67608), DCD4P-gamma (No.67609) and DCD4E-gamma-1 (No.67610). The plasmid containing (DCD4E-gamma-1) has been deposited in E. coli (MC1061/P3) at the ATCC under accession number 67610. (Updated on

                                                                                                                                                The present sequence is that of fusion protein CD4Egammal comprising the extracellular portion of CD4, which binds to HIV gpl20, linked at its C-terminus to the human IgG1 heavy chain. To obtain the fusion protein, DNA encoding CD4 was linked to IgG1 DNA at the Esp site upstream of the hinge region (see AAA50661). Fusion protein CD4Egammal and a nucleic acid encoding it are claimed. Also claimed are a vector comprising the nucleic acid, and a method of producing the fusion protein in secreted form using a transformed host cell. The fusion protein may further comprise a therapeutic agent, radiolabel or NMR imaging agent. The fusion protein can be administered to an animal (including humans) for treatment of HIV or SIV infection, and can also be used in assays for HIV or SIV, imaging and tissue stains. IgG1 fusion proteins such as CD4Egammal provide both complement-mediated and cell-mediated immunity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Seed

The products pf the invention have anti-human immunodeficiency virus (HIV) activity and are capable of binding to gp120. The fusion protein is useful for treating human immunodeficiency virus (HIV) or simian immunodeficiency virus (SIV). This sequence represents the fusion protein CD4Egammal which is constructed from CD4 linked to human IgG1 upstream of the hinge region

The fusion protein is capable of being secreted. The fusion proteins are useful for treating HIV or SIV infections in animals, preferably humans. They are also useful for producing medicaments which can be used for treating HIV or SIV infections in bundans. The present sequence represents the fusion protein CD4Egammal where the CD4 is linked to human IgG1 at the Esp site upstream

```

was produced by expression of the coding mutagenised cDNA (produced as described in AAQ28088) in Dhfr-CHO cells. The protein is efficiently assembled intracellularly and effectively secreted from mammalian cells pref. CHO, COS, or myeloma cells as a homodimer, enabling high recovery and purification from the medium of cells expressing it. It possesses

represents a CD4-gamma2

chimeric heavy chain homodimer.

It can inhibit HIV infection of CD4+ cells and block the spread of HIV infection within a patient. Attachment to a detectable marker makes it useful in an assay for HIV or SIV infection, and it can also be linked to toxins, eg Diphtheria, Pseudomonas exotoxin A (domainS I or II) or the deglycosylated A-chain of ricin. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 24-OCT-2003 to standardise OS field)

The resulting immunoconjugate comprising the toxin can be used to kill HIV infected cells and to treat HIV infected subjects to reduce the population of HIV infected cells. It can also be used to reduce the likelihood of infection. The immunoconjugate comprising the radionuclide can be used to image HIV infected tissue, to calculate the stage of HIV infection or the efficacy of an anti-HIV treatment using the imaging technique and for determining the prognosis of an HIV infected subject. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Non-peptidyl toxin or radionuclide and CD4-gamma 2 or CD4-IgG2 immuno:conjugates - used to kill HIV-infected cells and to image HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 432 AA;

The cytotoxic radionuclide is CC linked to either the heavy chains or the light chains, or to all four CC chains, directly or through a bifunctional chelator. Both heavy chains CC are chimeric CD4-Ig (immunoglobulin) G2 chains encoded by vector CD4- [CC chains encoded by vector CD4- kLC-pRcCMV (ATCC 75194). CD4 is a non-CC chains encoded by vector CD4- kLC-pRcCMV (ATCC 75194). CD4 is a non-CC chains encoded by vector CD4- kLC-pRcCMV (ATCC 75194). CD4 is a non-CC chains encoded by vector CD4- kLC-pRcCMV (ATCC 75194). CD4 is a non-CC chains encoded by vector CD4- kLC-pRcCMV (ATCC 75194). CD4 is a non-CC chains encoded by vector CD4- klc-pRcCMV (ATCC 75194). CD4 is a non-CC chains encoded by vector CD4- klc-pRcCMV (ATCC 75194). CD4 is a non-CC chains encoded by vector CD4- klc-pRcCMV (ATCC 75194). CD4 is a non-CC chains encoded by vector CD4- klc-pRcCMV (ATCC 75194). CD4 is a non-CC chains encoded by vector CD4- klc-pRcCMV (ATCC 75194). CD4 is a non-CC chains encoded by vector CD4- klc-pRcCMV (ATCC 75194). CD4 is a non-CC chains encoded by vector CD4- klc-pRcCMV (ATCC 75194). CD4 is a non-CC chains encoded by vector CD4- klc-pRcCMV (ATCC 75194). CD4 is a non-CC chains encoded by vector CD4- klc-pRcCMV (ATCC 75194). CD4 is a non-CC chains encoded by vector CD4- klc-pRcCMV (ATCC 75194). CD4 is a non-CC chains encoded by vector CD4-klc-pRcCMV (ATCC 75194). CD4 is a non-CC chains encoded by vector CD4-klc-pRcCMV (ATCC 75194). CD4 is a non-CC chains encoded by vector CD4-klc-pRcCMV (ATCC 75194). CD4 is a non-CC chains encoded by vector CD4-klc-pRcCMV (ATCC 75194). And the surface of a line encoded by vector CD4-klc-pRcCMV (ATCC 75194). And the surface of a line encoded by vector CD4-klc-pRcCMV (ATCC 75194). And the surface of a line encoded by vector CD4-klc-pRcCMV (ATCC 75194). And the surface of a line encoded by vector CD4-klc-pRcCMV (ATCC 75194). And the surface of a line encoded by vector CD4-klc-p

The invention is useful for killing human immunodeficiency virus (HIV)-infected cells, the treatment and prevention of infection with HIV

                                      The present invention relates to a method for inhibiting infection of a CD4+ cell by HIV. The method comprises contacting the HIV with a CD4-IgG2 chimeric heterotetramer to form a complex with the HIV (CD4 = cluster of differentiation 4; IgG2 = immunoglobulin gamma 2). CD4 is a cell surface glycoprotein that is expressed primarily on the surface of T cells. In man, CD4 is the target of interaction with HIV. The heterotetramer has two heavy and two light chains which are encoded by expression vectors CD4-IgG2HC-pRcCMV (VI) and CD4-KLC-pRcCMV (V2), respectively. The method is used to inhibit infection of a CD4+ cell by a HIV and to prevent CD4+cells of a subject from becoming infected with HIV. The method is also useful for treating a subject having CD4+ cells infected with HIV. The present sequence is human fusion protein: CD4-gamma2 chimeric heavy chain homodimer. This sequence was used in the method of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI; 2001-264981/27.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      08-FEB-1991;
10-FEB-1992;
08-DEC-1992;
                                                                                                                                                                                                                                                                                                                                                                             The invention describes a purified CD4-immunoglobulin (Ig)G2 chimeric heterotetramer (I) that neutralises human immunodeficiency virus-1 (HIV-1) having two heavy chains encoded by an expression vector designated CD-1gG2HC-pRcCMV. (I) light chains encoded by expression vector designated CD4-kLC-pRcCMV. (I) and a composition (II) comprising (I) or (II) inked to a toxin, are useful for inhibiting HIV infection of a CD4 cell, and preventing a subject being infected with HIV by blocking the spread of HIV infection. This is the amino acid sequence of the CD4-gamma2 chimeric heavy chain of the CD4-IgG2 chimeric heterotetramer useful in inhibiting HIV infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel CD4-immunoglobulin G2 chimeric heterotetramer neutralizes human immunodeficiency virus-1 with two heavy and light chains encoded by expression vectors designated CD4-IgG2HC-pRcCMV and CD4-kLC-pRcCMV,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 N-PSDB;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   24-OCT-2003
25-MAR-2003
06-FEB-1993
This sequence represents a CD4-IgG2 chimeric heavy chain heterotetramer It was produced by expresion of the coding mutagenised cDNA (produced as described in AAQ28089) in Dhfr-CHO cells. The protein is efficiently assembled intracellularly and effectively secreted from mammalian cells pref. CHO, COS, or myeloma cells as a heterotetramer, enabling high recovery and purification from the medium of cells expressing it. It possesses increased serum half-life and has increased avidity for HIV cf. heavy chain dimers. It can inhibit HIV infection of CD4+ cells and block the spread of HIV infection within a patient. This sequence represents the CD4-IgG2 chimeric heavy chain amino acid compenses of the computation of the computation of the computation of the invention relates to an immunoconjugate computation and two light chains. The cytotoxic compensation of the computation of the light chains or the light chains, or compensation of the light chains or the light chains, or compensation of the light chains, or compensation of the light chains, or compensation of the light chains, or compensation of the light chains or the light chains, or compensation of the light chains are chimeric CD4-Ig (immunoglobulin) G2 chains encoded by vector CD4-Ig (immunoglobulin) G2 chains encoded by vector CD4-Ig (immunoglobulin) G2 chains encoded by vector CD4-Ig (immunoglobulin) G2 chains encoded by compensation of the monocyte/macrophage lineage composition of the monocyte/macrophage lineage composition of the composition of the monocyte/macrophage lineage composition of the surface of antigen presenting cells to complex (MHC) class II molecules on the surface of antigen presenting cells to complex composition of interactions with the human immunodeficiency virus HIV. The complex composition of interaction infected with HIV, and for treating composition or prognosis of infection, and for assessing efficacy of complex composition or prognosis of infection, and for assessing efficacy of communoconjugate is also used for imaging HIV-infected tissues (for staging and prognosis of HIV infected patients. The immunoconjugate should be active against all strains of HIV (since the CC dimense) interaction is essential for infection). The heterotetramers communicated intracellularly and secreted efficiently from mammalian collings high recovery and purification from the culture medium. They have longer half-life in serum and greater avidity than heavy chain collings the collings of the collings of the collings of the collings of the collings of the collings of the collings of the collings of the collings of the collings of the collings of the collings
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   N-PSDB; AAZ98856.

                                                                                                                                                                           The present invention relates to an immunoconjugate, comprising a cytotoxic radionuclide linked, directly or via a bifunctional chelator, to a heterotetramer having two chimeric CD4-IgG2 heavy chains encoded by an expression vector CD4-IgG2HC-pRcCMV and two chimeric CD4-kappa light chains encoded by an expression vector CD4-kG-pRcMV. The invention is useful for killing human immunodeficiency virus (HIV)-infected cells, for the treatment and prevention of infection with HIV
                                                                                                                                                                                                                                                                                                          Immunoconjugate for treating human immunodeficiency virus-infected subject, consists of cytotoxic radionuclide linked to heterotetramer comprising two chimeric CD4-IgG2 heavy chains and two chimeric CD4-kappalight chains.
                                                                                                                                                       Sequence 530
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CD4-IgG2 chimeric
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAB67323

The present invention relates to a method for inhibiting infection of a CD4+ cell by HIV. The method comprises contacting the HIV with a CD4-IgG2 chimeric heterotetramer to form a complex with the HIV (CD4 = cluster of differentiation 4; IgG2 = immunoglobulin gamma 2). CD4 is a cell surface glycoprotein that is expressed primarily on the surface of T cells. In man, CD4 is the target of interaction with HIV. The heterotetramer has

The method is used to inhibit infection of a CD4+ cell by a HIV and to prevent CD4+ cells of a subject from becoming infected with HIV. The method is also useful for treating a subject having CD4+ cells infected with HIV. The present sequence is human fusion protein: CD4-Ig2 chimeric heavy chain of the CD4-IgG2 chimeric heterotetramer. This sequence was used in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention describes a purified CD4-immunoglobulin (Ig)G2 chimeric heterotetramer (I) that neutralises human immunodeficiency virus-1 (HIV-1) having two heavy chains encoded by an expression vector designated CD4-IgGENCPARCEMV. (I) and a composition (II) comprising (I) or designated CD4-kLC-pRcCMV. (I) and a composition (II) comprising (I) or (I) linked to a toxin, are useful for inhibiting HIV infection of a CD4 cell, and preventing a subject being infected with HIV by blocking the spread of HIV infection. This is the amino acid sequence of the CD4-immunoglobulin G2 chimeric heavy chain chimeric heterotetramer useful in this is the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel CD4-immunoglobulin G2 chimeric heterotetramer neutralizes immunodeficiency virus-1 with two heavy and light chains encoded expression vectors designated CD4-IgG2HC-pRcCMV and CD4-kLC-pRcC

The products pf the invention have anti-human immunodeficiency virus (HIV) activity and are capable of binding to gpl20. The fusion protein is useful for treating human immunodeficiency virus (HIV) or similar immunodeficiency virus (SIV). This sequence represents the fusion protein CD4Bgammal which is constructed from CD4 linked to human IgG1 upstream of the hinge region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              22-JAN-1988;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               206
```

The invention provides a fusion gene encoding a fusion protein that comprises an extracellular CD4 DNA sequence or its fragment which binds to HIV gpl20 when fused to an immunoglobulin (Ig) chain and the DNA sequence of an Ig heavy or light chain, where the DNA sequence encoding the variable region has been replaced with the DNA sequence which encodes

Example 1;

The fusion protein is capable of being secreted. The fusion proteins are useful for treating HIV or SIV infections in animals, preferably humans. They are also useful for producing medicaments which can be used for treating HIV or SIV infections in humans. The present sequence represents the fusion protein CD4Bgammal where the CD4 is linked to human IgG1 at the Banl site downstream from the hinge region
Fusion protein; diagnosis; CD4;
                                                                                                                                                                                                                        25-MAR-2003

The present sequence is that of fusion protein CD4Hgammal comprising textracellular portion of CD4, which binds to HIV gpl20, linked at its terminus to the human IgG1 heavy chain. To obtain the fusion protein, encoding CD4 was linked to IgG1 DNA at the Hind3 site upstream of the region (see AAA50660). Fusion protein CD4Hgammal and a nucleic acid encoding it are claimed. Also claimed are a vector comprising the nucl

The fusion protein may further comprise a therapeutic agent, radiolabel or NMR inaging agent. The fusion protein can be administered to an animal (including humans) for treatment of HIV or SIV infection, and can also be used in assays for HIV or SIV, imaging and tissue stains. IgGl fusion proteins such as CD4Hgammal provide both complement-mediated and cell-mediated immunity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence

The fusion protein is capable of being secreted. The fusion proteins are useful for treating HIV or SIV infections in animals, preferably humans. They are also useful for producing medicaments which can be used for treating HIV or SIV infections in animals, can be used for treating HIV or SIV infections in enimals. The present sequence represents the fusion protein CD4Hgammal where the CD4 is linked to human IgG1 at the Hind3 site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 729 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New fusion gene encoding immunoglobulin-CD4 fusion proteins, useful the treatment of HIV or simian immunodeficiency virus infections.

The products pf the invention have anti-human immunodeficiency virus (HIV) activity and are capable of binding to gpl20. The fusion protein is useful for treating human immunodeficiency virus (HIV) or simian immunodeficiency virus (SIV). This sequence represents the fusion protein CD4H-1 which is constructed from CD4 linke to human IgG1 upstream of the CH1 region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          22-JAN-1988;
